

# Hard Aground! Now What!

■ by VINCENT T. PICA, II

Division Commander, 18-06 (ISR) - United States Coast Guard Auxiliary

When I teach seamanship courses to private boaters on the South Shore, I note that, if you boat in our local waters and have never run aground, you're lying. Even USCG regulars have been known to "touch bottom" at times in these waters... So, the issue is not if you run aground but what you do afterwards.

There are a couple of things to do right away. First, determine if the grounding has caused a leak. Even sand, if you hit it hard enough, will stove in a hull (or a through-hull fitting or a drive shaft fitting through a stuffing box.) While the water obviously isn't very deep right where you are, if your hull starts to fill with water, she may slide into deeper water and now problems will start to escalate. At roughly the same time, get everyone into life jackets. You're the skipper and are responsible for the safety of everyone on that vessel. Secondly, check your tide charts and determine if time is an ally or an enemy, i.e., if the tide rises

(the rising tide lifts all boats said John Kennedy) or falling. If it is falling, time is now working against you. (see SSP article on "Time Waits for No (Wo)Man", Sept 13, 2006; also check the tide tables provided by SSP.)

## Now What?

So, at this point, you know if the boat has sprung a leak (if so, get right on VHF-16 and hail the USCG; get the "rescue starts now" clock ticking asap); you have everyone in life jackets and you know if you will be helped by time or not. This should have taken you less than 1 minute. If the hull isn't leaking, try backing away the way you came in. Increase throttle moderately and keep turning the wheel back and forth, port to starboard and back again. Why? Well, to some degree, it is like rocking a car in the snow. Sand and boats can get into a very powerful embrace caused by suction of the wet sand and a smooth surface of a boat's hull. But, secondly and perhaps

more importantly, you are sending sand from the stern directly forward - increasing the "hump" that you have to float over. By turning the wheel, you'll break the suction and spread the sand around. Be conscious of what is behind you because, if you suddenly break free, you don't want to go flying into a busy seaway. Assuming this is working, it is quite possible that you will find yourself making more progress when the wheel is to one side or the other. Once you see the stern making more way down one exit path then the other, make that your new centering path. In short, don't waste time and fuel trying to back down a path that isn't getting you anywhere - but don't fail to sway the helm back and forth down your new exit path or you may fill it with sand and ruin your escape... Most times, this will get you out.

## I'm Free - Or Am I?

If it does, unless you got out pretty quickly and easily, I would head for the marina and

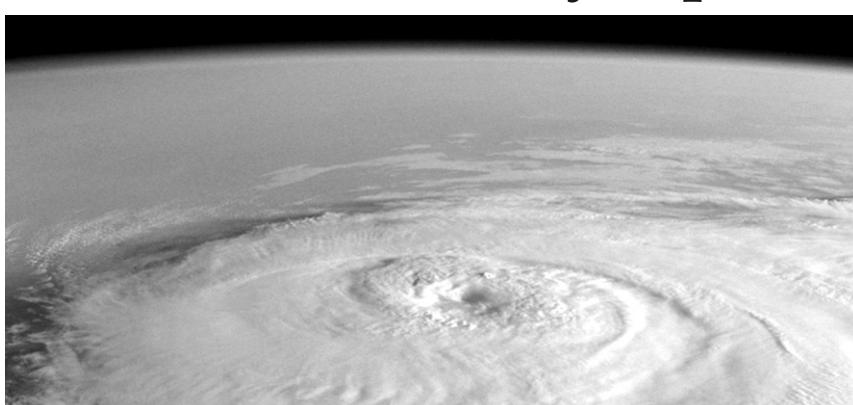

get a hose on that engine and start to wash out the sand. I'd also have somebody look at the running gear. A small nick in a prop can do a lot of damage to an engine's "innards" because the running gear is no longer balanced. At a minimum, get the boat somewhere where you can get a water hose on the engine and flush it - with the engine OFF. If there is sand in there, don't grind it out of your engine. Wash it out.

What if you are at this for 4-5 minutes and nothing is happening? Well, if the tide is against you, and you have towing insurance, call for help. Any more time wasted and you might be spending the night. The commercial towers are well equipped and largely well-trained. (You DON'T have towing insurance..?) Think again, bunky... It is the cheapest insurance that you will use.) Get familiar with the differences between "salvage" and a simple tow, especially if you don't have contracted commercial insurance. Maritime law is complex...

But what if the tide is with you? Well, you can still call for help but you also have an opportunity to engage in some seamanship that might hold you in good stead sometime in the future when you have more difficult circumstances in hand. How about putting an anchor out towards the deeper water and "keding", i.e., pulling yourself along it from the bow? You are introducing a new angle of pressure and that might pull you free or at least loosen the bottom-suction. At a minimum, as the tide rises, it will keep you from being blown higher on to the beach by the wind. If your boat is big enough to have a tender(dinghy), get it to work pushing the boat. Think like what you are. A sea captain.

BTW, if you are interested in being part of USCG Forces, email me at [JoinUSCGAux2008@aol.com](mailto:JoinUSCGAux2008@aol.com) or go direct to MaryJo Cruickshank, who is in charge of new members matters, at [FSO-PS@emcg.us](mailto:FSO-PS@emcg.us) and we will help you "get in this thing..."

## Suffolk County Clerk's Hurricane Safety Tips

Suffolk County Clerk Judith A. Pascale has issued the following document safety tips for this hurricane season.

"The devastation wrought by recent hurricane seasons serves as a strong reminder that hurricane preparedness needs to be pushed to the forefront of everyone's agenda. Experts agree that storing key documents in safe locations provides the maximum level of security and convenience in the aftermath of a catastrophe like a major hurricane," commented Suffolk County Clerk Judith A. Pascale.

Safety deposit boxes, rented for less than \$20 a year from many banks, can affordably provide piece of mind. For on-site home storage, consider a fire-proof lockable box. Storing key documents in a compact location will allow instant access to the basic information one needs to begin recovering from a disaster. These boxes can be purchased from household goods and office supply stores for as little as \$25.

"While safes and safety deposit boxes are among the best places to store your most sensitive documents, I want to assure all Suffolk County residents that a permanent copy of all documents recorded in our Office, i.e. deeds, mortgages, powers of attorney, etc., are readily available, should an unfortunate disaster strike," commented Pascale.

By digitally scanning and retaining land records, digital surrogates are utilized in place of the actual hard copies to preserve land transactions while also providing for an efficient and effective safeguard of the land records of Suffolk County.

"Although traditional paper mediums are increasingly susceptible to disaster, we utilize state-of-the-art computer storage systems to hold digital images of these paper mediums to provide an added layer of security in the protection of the public record," concluded Suffolk County Clerk Judith A. Pascale.

**EAST END HOSPICE**

**Caring for the people of Long Island's East End . . .**

*"You were a tremendous help to my family. May God bless you all." - Riverhead*

*"Your care was so affectionate and personal that our beloved father felt as if it was us ministering to him." - Moriches*

*. . . pain and symptom control in a familiar and loving environment at home . . . individualized plan of care and comfort under direction of the primary physician, with short term hospitalization when needed . . . bereavement care for families.*
